While methods of tracking cats exist, none of them provide an open source integration with Life360.

Cats in cities like Columbia often get lost, or their owners have a need to find them. Families often use Life360 to keep track of each other, so it seems natural that a family's cats should be kept track of this way as well. Unfortunately, the pet trackers provided by Life360 are closed source and don't follow free software conventions. There are open source pet tracking options like Find My Cat, but these don't integrate nicely with Life360.

My goal is to create a tool that makes generic GPS trackers work better with apps like Life360.
